Problem 5

10.0 points possible (graded)

Write a Python function that takes in a string and prints out a version of this string that does not contain any vowels, according to the specification below. Vowels are uppercase and lowercase 'a', 'e', 'i', 'o', 'u'.

For example, if `s = "This is great!"` then `print_without_vowels` will print `Ths s grt!`. If `s = "a"` then `print_without_vowels` will print the empty string `""`.

```
def print_without_vowels(s):  
    '''  
    s: the string to convert  
    Finds a version of s without vowels and whose characters appear in the  
    same order they appear in s. Prints this version of s.  
    Does not return anything  
    '''  
  
    # Your code here
```

```
1 # Paste your function here
```

Press ESC then TAB or click outside of the code editor to exit
