Problem 3

Problem 3 - Printing Out all Available Letters

10.0 points possible (graded)

Next, implement the function `getAvailableLetters` that takes in one parameter - a list of letters, `lettersGuessed`. This function returns a string that is comprised of lowercase English letters - all lowercase English letters that are **not** in `lettersGuessed`.

Example Usage:

```
>>> lettersGuessed = ['e', 'i', 'k', 'p', 'r', 's']
>>> print(getAvailableLetters(lettersGuessed))
abcdfghjlmnoqtuvwxyz
```

Note that this function should return the letters in alphabetical order, as in the example above.

For this function, you may assume that all the letters in `lettersGuessed` are lowercase.

Hint: You might consider using `string.ascii_lowercase`, which is a string comprised of all lowercase letters:

```
>>> import string
>>> print(string.ascii_lowercase)
abcdefghijklmnopqrstuvwxyz
```

```python
1  def getAvailableLetters(lettersGuessed):
2      '''
3      lettersGuessed: list, what letters have been guessed so far
4      returns: string, comprised of letters that represents what letters have not
5        yet been guessed.
6      '''
7      # FILL IN YOUR CODE HERE...
8
```
